Tiki-Toki . Introducing Translation Studies [by Routledge] - Timeline. 68 stories
www.tiki-toki.com/timeline/entry/31805/Introducing-Translation-Studies/.
The names and terms that appear in the timeline are a selection of those that are discussed in Introducing Translation Studies. The names are not meant to be a comprehensive list of all those who have contributed to the field. The date associated with each entry generally relates to the first or most highlighted contribution about the concept or by the figure. Some dates are approximate. Within each entry, underlining is used to cross-refer to other entries in the timeline.

Theories/Developments | Theorist
1. Greek Septuagint (300 BC - 100 BC) –The Septuagint is the Greek translation of the Hebrew Scriptures that was adopted by the Christians. Its translation process, which spanned over a long period starting in the 3rd c BCE and ending in the 1st c BCE, took place in stages and has been described as 'the first major translation in western culture' (Tessa Rajak, Translation and Survival: The Greek Bible of the Ancient Jewish Diaspora, OUP, 2009). Some believed that the translators who worked in the process had divine inspiration. The Septuagint became the basis of old Latin versions of the Bible, collectively known as the Vetus Latina, and also of the Coptic, old Slavonic, old Armenian, old Georgian and old Syriac versions of the Old Testament. St Jerome also used it (see St Jerome), along with the Hebrew version, for his translation of the Bible.

2. 46 BC | **Marcus Tullius Cicero** (106-43 BCE) - Roman rhetorician and politician. In his work *De optimo genere oratorum* (46 BCE) he outlines his approach to translation as avoiding the then normal practice of 'word-for-word' translation (see St Jerome), which replaced each individual word of the ST with its closest grammatical equivalent in the TL, aiming instead to reproduce the 'general style and force of the language'. In Western translation theory Cicero is often identified with the concepts of literal and free translation.

'Literal' translation - 'Literal' translation, as opposed to 'free' translation, is understood as a type of translation that adheres closely to the surface structures of the ST message, both in terms of semantics and syntax. The term 'literal translation' has been used by scholars in different ways. In the 1950s, Vinay and Darbelnet use it as synonym of what they call direct translation and also to refer to one of the three procedures used in direct translation whereas the term 'free' translation is used within the framework of oblique translation (see Vinay and Darbelnet) . Antoine Berman on the other hand, uses the term to refer to the 'signifying process' that allows translators to bring the sense of the foreign into the TT (see Antoine Berman).
'Free' translation - 'free' translation, as opposed to 'literal' translation, attempts to recreate a text that sounds natural in the TL and therefore does not necessarily adhere closely to the SL elements and structures. (See also 'sense-for-sense' in St Jerome).

3. 148 CE - 265 CE | Sutra translations (1st phase) | **Sutra translations** - The translation of Buddhist Sutras from Sanskrit into Chinese spanned many centuries and took place in three phases from around 148 to 1100 CE. The preferred strategy moved from a *zhìyì* , word-for-word

The color 🔵 is used to highlight names of entries for Theories/Concepts, while the color 🔴 is used to highlight entries on Figures

(see St Jerome) rendering that adhered closely to the SL, often used transliteration and was difficult to understand, especially by those without a theological grounding, to a *yìyì* translation, a concept associated with free translation (see Cicero). *Yìyì* was strongly advocated by Kumārajīva (344-413) who had been greatly influenced by Dào'ān, a pioneer of this approach (see separate entry for Dào'ān). The third phase was mainly dominated by Xuán Zàng (602-664), who advocated a translation that replicated the style of the original text.

4. 256 CE - 589 CE | Sutra Translations (2nd Phase) | Sutra translations - The translation of Buddhist Sutras from Sanskrit into Chinese spanned many centuries and took place in three phases from around 148 to 1100 CE. The preferred strategy moved from a zhìyì , word-for-word (see St Jerome) rendering that adhered closely to the SL, often used transliteration and was difficult to understand, especially by those without a theological grounding, to a yìyì translation, a concept associated with free translation (see Cicero). Yìyì was strongly advocated by Kumārajīva (344-413) who had been greatly influenced by Dào'ān, a pioneer of this approach (see separate entry for Dào'ān). The third phase was mainly dominated by Xuán Zàng (602-664), who advocated a translation that replicated the style of the original text.

5. 312 CE - 385 | Dao'an | Dào'ān (312-385) - Buddhist monk who undertook the translation of the Sanskrit Sutras. In the third preface to the translation of the Prajñāpāramitā (382 CE), he identified the shiben ('losses', where meaning was subject to change in translation), and the buyi ('difficulties' or 'not deviating from the text'). Dào'ān's writings were very influential to many, including the translator and commentator Kumārajīva.

6. 395 CE | St. Jerome | **St Jerome** (347-420) - Theologian and historian who in 395 completed his translation of the Bible commissioned by Pope Damasus. This would later become known as the *Latin Vulgate*. As a basis for it, St Jerome took not only the Greek Septuagint, the traditional reference, but also the Hebrew version of the Bible, in what was a controversial decision at the time (see Greek Septuagint). Thus, St Jerome was the first to note differences between the two versions. St Jerome explained that he had translated 'not "word-for-word" but "sense-for-sense"', therefore setting out the dichotomy that would dominate much of the study of translation until the 20th century.

'word-for-word' – 'word for word' translation, as opposed to its opposite 'sense-for-sense' translation, refers to a form of translation in which a SL word is replaced by the closest TL correspondent (see also 'literal translation' in Cicero).

The color 🔵 is used to highlight names of entries for Theories/Concepts, while the color 🔴 is used to highlight entries on Figures

'sense-for-sense' - 'sense-for-sense' translation, as opposed to its opposite 'word-for-word' translation, attempts to translate the meaning of the word within its context and within target language requirements. (See also 'free' translation' in Cicero).
'fidelity', 'spirit' and 'truth' - The use of these concepts has varied through time. Fidelity, or faithfulness, was dismissed by the Roman poet Horace (65 – 8 BCE) as literal 'word–for–word' translation. However, at the end of the seventeenth century fi trans had come to be identified with faithfulness to the meaning rather than the words. Spirit similarly has been used in various ways: the Latin word spiritus denotes creative energy or inspiration, proper to literature, but St Augustine (354-430 CE) used it to mean the Holy Spirit of God, and his contemporary St Jerome employed it in both senses. Much later, spirit lost the religious sense and was used in the sense of the creative energy of a text or language. For St Augustine, spirit and truth (Latin veritas) were intertwined, with truth having the sense of 'content'; for St Jerome, truth meant the authentic Hebrew Biblical text to which he returned in his Latin Vulgate translation. In the twelfth century, that truth became fully equated with 'content'.

7. 602 CE - 664 | Sutra Translations (3rd Phase) | Sutra translations - The translation of Buddhist Sutras from Sanskrit into Chinese spanned over many centuries and took place in three phases from around 148 to 1100 CE. The preferred strategy moved from a zhìyǐ, word-for-word (see St Jerome) rendering, that adhered closely to the SL, often used transliteration and was difficult to understand, especially by those without a theological grounding, to a yìyì translation, a concept associated with free translation (see Cicero). Yìyì was strongly advocated by Kumārajīva (344-413) who had been greatly influenced by Dào'ān, a pioneer of this approach (see separate entry for Dào'ān). The third phase was mainly dominated by Xuán Zàng (602-664), who advocated a translation that replicated the style of the original text.

8. 750 CE - 1250 CE | Abbasid Period of Translation | Abbāsid period of translation (750-1250) – A period of intense translation activity centred in Baghdad, encompassing a range of languages and topics but centred on the translation into Arabic of Greek scientific and philosophical material, often with Syriac as an intermediary language. Initially, a highly literal translation method (see Cicero) was adopted, where the Greek word was given an equivalent Arab word and Greek terms were borrowed into Arabic. When this method proved unsatisfactory, there was a shift towards 'sense-for sense' translation (see St Jerome).

9. 1369 CE - 1444 | Leonardo Bruni | Leonardo Bruni (1369-1444) - Italian humanist who translated philosophical works of the Classical Greek and Latin authors and occupied high

The color 🔵 is used to highlight names of entries for Theories/Concepts, while the color 🔴 is used to highlight entries on Figures

ecclesiastical office. Bruni placed strong emphasis on retaining the style of the original author, which he saw as an amalgam of the order and rhythm of the words and the 'polish and elegance' of the original. He felt that this was the only correct way to translate.

10. 1483 CE - 1546 | Martin Luther | Martin Luther (1483-1546) – German priest and theologian who was a leading figure of the Protestant Reformation in Europe. He translated first the New Testament (1522) and later the Old Testament (1534) into East Central German, which went a long way to reinforcing that form of the German language as standard. To the accusation that he had altered the Holy Scriptures in his translations, he countered by saying that he was translating into 'pure, clear German' and rejected a 'word-for-word' translation (see St Jerome) strategy since it would be unable to convey the same meaning as the ST.

Protestant Reformation – European Christian reform movement of the early 16th century that objected to some of the established doctrines, rituals and structure of the Catholic Church. The Protestant movement challenged the Church control over thinking and religion through the translation of the Latin version of the Bible into vernacular languages. It was preceded and influenced by the European Humanist movement of the 14th and 15th centuries, which advocated the recovery of classical Latin and Greek and their secular writers. The translation of any book which diverged from the Church's interpretation could be considered heretical, being censured or banned, and the translators ran the risk of entering into conflict with the Church. Such was the case of Tyndale and Dolet and Martin Luther, a crucial figure in the Reformation (see also William Tyndale and Étienne Dolet) . The Protestant Reformation was to lead to a huge schism within Christianity.

11. 1494 CE - 1536 | William Tyndale | William Tyndale (1494-1536) - English scholar and translator, he was said to have mastered ten languages, including Hebrew. His English Bible, produced in exile, was later used as the basis for the Geneva Bible (1560) and King James Version (1611). It was banned and copies confiscated on the orders of King Henry VIII. Tyndale was abducted, tried for heresy and executed in the Netherlands in 1536.

12. 1509 CE - 1546 | Étienne Dolet | Étienne Dolet (1509-1546) - French scholar and translator. In his 1540 manuscript La manière de bien traduire d'une langue en aultre he set out five principles of the process of translation in order of importance. He was condemned by the theological faculty of Sorbonne in 1546, apparently for adding, in his translation of one of Plato's dialogues, the phrase rien du tout ('nothing at all') in a passage about what existed after death. This led to the accusation that Dolet did not believe in immortality and he was burned at the stake.

The color 🔵 is used to highlight names of entries for Theories/Concepts, while the color 🔴 is used to highlight entries on Figures

13. 1631 - 1700 | John Dryden | John Dryden (1631-1700) - English poet and translator. In the preface to his translation of Ovid's Epistles in 1680, Dryden reduces all translation to three categories: (1) metaphrase, or 'word by word and line by line' translation, which corresponds to literal translation; (2) paraphrase: '[where the author's] words are not so strictly followed as his sense' and which this more or less corresponds to faithful or sense-for-sense translation; and (2) imitation, a free adaptation (see 'literal translation' in Cicero and word-for-word and sense-for-sense translation in St Jerome) .

14. 1747 - 1813 | Alexander Tytler (Lord Woodhouselee) | Alexander Tytler (Lord Woodhouselee) (1747-1813) - Scottish historian and professor. His treaty 'Essay on the principles of translation' (1790) constitutes one of the first comprehensive and systematic studies of translation. Tytler defines a 'good translation' as being oriented towards the target language reader and set out three general 'laws' or rules that should guide a good translation: (1) it should fully represent the ideas of the original, (2) it should render the style of the original and (3) should have the ease of the original composition.

15. 1768 - 1834| Friedrich Schleiermacher | **Friedrich Schleiermacher** (1768-1834) - German theologian and philosopher. In his seminal lecture Über die verschiedenen Methoden des Übersetzens ['On the different methods of translating'] (1813) he expounded a Romantic approach to interpretation based not on absolute truth but on the individual's inner feeling and understanding. He distinguished two types of translator: Dolmetscher and Übersetzer. Schleiermacher considers there to be only two paths open for the 'true' translation: to move the writer to the reader or to move the reader to the writer, Schleiermacher's preferred approach. In order to achieve this, the translator must adopt an 'alienating', rather than a 'naturalizing' method. Schleiermacher's influence has been considerable (see Venuti and Walter Benjamin and hermeneutics).

Dolmetscher and Übersetzer- According to Schleiermacher, a 'Dolmetscher' works on commercial texts, whereas an 'Übersetzer' works on scholarly and artistic texts.
'alienating' or 'foreignizing' is described by Schleiermacher as a method of translation in which the value of the foreign is emphasised by "bending" TL word-usage to try to ensure faithfulness to the ST
'naturalizing' – The second method of translation described by Schleiermacher, by which the foreign text is brought in line with the typical patterns of the TL.

16. 1805 - 1897 | Newman and Arnold | Francis William Newman (1805-1897) and Matthew Arnold (1822-1888) - Classics scholars in Victorian Britain who engaged in a public and acrimonious debate over the preferred strategy for the translation of Homer. Newman sought to emphasize the foreignness of the work by a deliberately archaic (or mock-archaic) translation that set itself against the prevailing translation practice of the day. This was

The color 🔵 is used to highlight names of entries for Theories/Concepts, while the color 🔴 is used to highlight entries on Figures

opposed by Matthew Arnold, who criticized Newman's poor usage and advocated a more transparent translation method that paid homage to the grand style of Homer. According to Arnold, whose argument won the day, scholars are the only ones qualified to evaluate the effect of a translation.

17. Yán Fù (1854-1921) - Chinese thinker and translator who proposes three translation principles of xìn (fidelity / faithfulness / trueness), dá (fluency / expressiveness / intelligibility / comprehensibility) and yǎ (elegance / gracefulness). These concepts became central to much twentieth-century Chinese translation practice and theory, even if they have since been criticized by more linguistic theorists (see 'fidelity', 'spirit' and 'truth' in St Jerome).

18. 1923 | Philosophical approaches to Translation | See: Walter Benjamin -1923; George Steiner – 1975; Deconstruction – 1960 to present date; 'Abusive fidelity' - 1985

19. 1923 | Walter Benjamin | Walter Benjamin (1892-1940) – literary critic and essayist, philosopher and translator. Benjamin saw language as magical and its mission to reveal spiritual content. In his seminal essay 'The Task of the Translator' (1923), he suggests that translation serves to 'express the central reciprocal relationship between languages', not by seeking to be the same as the original but by bringing together the two different languages in a 'pure' and higher language. The strategy to achieve this is through literalism which allows the pure language to shine through.

20. 1950 | Machine Translation | Machine translation (MT) – Translation automatically generated by computer software. It has its origins in the 1950s. Online packages are mostly used for comprehension. However, increasingly more complex packages are being used for dissemination, for example by the European Commission, in order to provide a draft first translation of documents which are then revised by a human translator or editor.

21. 1958 | Analysing Translation Products and Processes | See: Vinay and Darbelnet -1958; Ian Catford -1965; Jiří Levý - 1963; Cognitive models of translation – 1991 to present date

22. 1958 | Vinay and Darbelnet | Jean Paul Vinay (1910-1999) and Jean Darbelnet (1904-1990) – In their Stylistique comparée du français et de l'anglais (1958, Comparative Stylistics of French and English, 1995) they carried out a comparative stylistic analysis of French and English, noting differences between the languages and translation shifts and identifying different translation 'strategies' and 'procedures'. Vinay and Darbelnet described two different strategies for translation: Direct and Oblique translation. They also classified

The color 🔵 is used to highlight names of entries for Theories/Concepts, while the color 🔴 is used to highlight entries on Figures

the procedures that occur in the process of translation and the constraints of 'servitude' and 'option'.

Direct and Oblique translation: According to Vinay and Darbelnet, direct translation occurs when two languages show close correspondence in terms of lexis and structure. Oblique translation applies when restructuring is involved. (compare with literal translation and free translation in Cicero).

These two strategies cover between them seven translation procedures:
1 Direct translation uses the procedures of Borrowing, Calque and Literal translation.
2 Oblique translation covers the procedures of Transposition, Modulation, Équivalence and Adaptation.

These categories operate at different levels of language: the lexicon, the syntactic structures and the message.
'Servitude' and 'option': In Vinay and Darbelnet's model, 'servitude' refers to the obligatory transpositions and modulations due to a difference between the two language systems, whereas 'option' refers to non-obligatory changes that may be due to the translator's own style and preferences, or to a change in emphasis. It is 'option', according to Vinay and Darbelnet, that should be the translator's main concern.
Translation strategies and procedures In the technical sense a strategy is an overall orientation of the translator (e.g. towards 'free' translation or 'literal' translation [see in Cicero], towards the TT or ST, towards 'domestication' or 'foreignization' [see Venuti]) whereas a procedure is a specific technique or method used by the translator at a certain point in a text (e.g. The borrowing of a word from the SL, the addition of an explanation or a footnote in the TT).

23. 1959 | Roman Jakobson | **Roman Jakobson** (1896-1982) — Russian-American structural linguist. In his paper 'On linguistic aspects of translation' (1959/2004), he describes three categories of translation: intralingual, interlingual and intersemiotic. Working from the relationship between signifier and signified set out by Saussure, he examines the problem of equivalence in meaning between words of different languages.

Intralingual, interlingual and intersemiotic translation: Three categories of translation described by Jakobson (1959/2004):
'Intralingual' translation, or 'rewording', is an interpretation of verbal signs by other signs in the same language. For example, a rewording of an expression in Spanish from a Spanish source text.
'Interlingual' translation, or 'translation proper' is 'an interpretation of verbal signs by means of some other language'. For example, a translation of a text from Arabic to Mandarin.
'Intersemiotic' translation is the 'interpretation of verbal signs by means of signs of non verbal-signs systems'. For example, a book adapted as a film.
Equivalence in meaning – for Jakobson, a key issue in translation is equivalence in meaning between 'code-units' of different languages or 'sign systems'. Because each language is a different system, full equivalence between code units in ST and TT is not usually possible

The color 🔵 is used to highlight names of entries for Theories/Concepts, while the color 🔴 is used to highlight entries on Figures

(e.g., be in English, sein in German, etc., breaks down into ser and estar in Spanish and is absent in Russian and Arabic). Such cross-linguistic systemic differences do not mean that a message is necessarily untranslatable into another verbal language, just that some adjustment needs to be made using translation procedures (see 'Translation strategies and procedures' in Vinay and Darbelnet). Equivalence is a recurrent, important and at times controversial concept in modern translation theory (see also Formal and dynamic equivalence and Equivalent effect in Nida and Equivalence in Koller).
Ferdinand de Saussure (1857-1913) – Swiss linguist whose seminal work led to the establishment of semiology and structural linguistics. His Course in General linguistics (published posthumously in 1916) analyses language as a formal system of signs. It is divided into two components: langue, which refers to the abstract system internalized by a given speech community, and parole, the individual acts of speech that put language into practice. The linguistic sign is composed of the signifier and the signified.

24. 1959 | The Question of Equivalence | See: Roman Jakobson - 1959; Eugene Nida - 1964; Peter Newmark - 1981; Werner Koller – 1979

25. 1963 | Jiri Levy | Jiří Levý (1926-1967) Literary and translation theoretician born in Slovakia (then part of Czechoslovakia), whose work is linked to the tradition of the Prague School of structural linguistics. In his book Umění prěkladu (1963), known in western Europe through its German translation Die literarische Übersetzung: Theorie einer Kunstgattung (Levý 1969) and now translated into English as The Art of Translation (2011), he introduces the literary aspect of the 'expressive function' or style of a text. Paying special attention to poetry in his analysis, he sees literary translation as both a reproductive and a creative labour with the goal of equivalent aesthetic effect (see also 'Equivalent effect' in Nida).

26. 1964 | Eugene Nida | **Eugene Nida** (1914-2011) American Baptist minister, linguist and translator, he had enormous experience organizing the translation of the Bible into indigenous languages. He applied analytical concepts from Noam Chomsky's generative-transformational grammar in his 'scientific' approach towards translation theory and lexical meaning (Nida 1964, Nida and Taber 1969/1974). Nida described two types of equivalence in translation: formal and dynamic equivalence. For Nida, the success of a translation depended above all on achieving an equivalent effect.

Lexical meaning – Nida analyses three types of meaning:

(1) linguistic meaning (the relationship between different words, for example, *his return* may mean *when he returned.*

(2) referential or denotative meaning, which is the dictionary meaning of a word.

(3) connotative or emotive meaning, the associations a word may have. So, *he went to France* and *he swanned off to France* may have the same referential meaning but the connotative meaning is different, the latter suggesting a negative view of what he has done.

The color 🔵 is used to highlight names of entries for Theories/Concepts, while the color 🔴 is used to highlight entries on Figures

Formal and **dynamic equivalence** and **equivalent effect** These concepts represent two general orientations proposed by Nida (1964). Formal equivalence is focused on the message of the ST, which produces a TT which follows the content and the linguistic structures as closely as possible. In dynamic equivalence, the message of the ST is transferred in such a way that the effect on the receptor is as similar as possible to the effect on the ST reader (known as the principle of equivalent effect). This requires the translator to adjust the text to the target culture. This move towards a receptor-oriented approach represented a radical departure from 'free' and 'literal' translation (see Cicero). In Nida and Taber (1969/74), 'formal correspondence' is used in place of 'formal equivalence' and 'functional equivalence' in place of 'dynamic equivalence'. (See also Equivalence in meaning in Jakobson and Equivalence in Koller)

Noam Chomsky American linguist and cognitive scientist. His generative-transformational grammar of the 1950s-60s considers language to be a body of knowledge innate and universal to all. Sentences and structures are analysed as a series of related levels governed by rules that move from deep structure through transformational rules to a surface structure.

27. 1965 | John C. Catford | John C. Catford (1917-2009) – In his book A Linguistic Theory of Translation (1965), Catford applies advances in linguistics to translation by following the linguistic model of Firth and Halliday (see House) . Catford distinguishes between formal correspondence and textual equivalence in translation, two concepts that will later be developed by Koller (see separate entry for Koller). Catford also makes a detailed description of the translation shifts that take place in the translation process.

Formal correspondence and textual equivalence: Catford defines 'formal correspondent' in translation as 'any TL category (unit, class, element of structure, etc.) which can be said to occupy, as nearly as possible, the "same" place in the "economy" of the TL as the given SL category occupies in the SL'(Catford 1965: 27), whereas 'textual equivalent' refers to 'any TL text or portion of text which is observed. . . to be the equivalent of a given SL text or portion of text' (ibid.). (See Equivalence in meaning in Jakobson).

Translation shifts: Catford coined the term to describe 'departures from formal correspondence in the process of going from SL to TL'. He considers two kind of shifts (a) level shifts (when something is expressed by grammar in one language and by lexis in another) and (b) category shifts, these later subdivided into structural, class, unit (or rank) and intrasystem shifts. (See also Vinay and Darbelnet).

28. 1971 | Text Type and Genre | See: Katherina Reiss - 1971; Mary Snell-Hornby -1988

29. 1971 | Katharina Reiss | Katharina Reiss — German linguist and translation scholar whose work views the text rather than the word or sentence as the level at which

The color 🔵 is used to highlight names of entries for Theories/Concepts, while the color 🔴 is used to highlight entries on Figures

communication is achieved and equivalence (see Equivalence in Nida and Koller) must be sought. Based on Karl Bühler's earlier categorization of the three functions of language, Reiss formulated a functional model of genre and text type which describes three types of text: informative, expressive and operative. Each of these text types requires a different type of translation method and the translation of the predominant function of the ST should be the determining factor guiding the translation.

30. 1972 | James S. Holmes | **James S. Holmes** (1924-86) – Dutch-based scholar who named and defined the field of translation studies as a distinctive discipline. Holmes put forward an overall framework, describing what translation studies should cover, comprising two branches:

1.the 'pure' branch, subdivided into a 'descriptive' branch (which deals with the description of what happens in translation and is known as Descriptive Translation Studies [see Descriptive translation Studies and Gideon Toury]), and the 'theoretical' branch (which deals with the establishment of general principles to explain and predict translation phenomena)
2.an 'applied' branch (which refers to translator training, tools and criticism)

31. 1972 | Translation Studies as a Discipline | *See: James S. Holmes - 1972*

32. 1975 | George Steiner | **George Steiner** – literary critic, essayist and academic. In his influential book *After Babel* (1975) Steiner approaches translation from the point of view of hermeneutics. Steiner proposes a totalising model, which he terms hermeneutic motion.

Hermeneutics – Term derived from the Greek verb *hermeneuein* meaning to *interpret*. Originally used to refer to the interpretation of the Bible, the German Romantics of the eighteenth and nineteenth century widened its use to refer to the theory, methodology and processes involved in interpreting all types of text with the aim of discovering its meaning. It focuses on how the recovery of meaning is influenced by the fact that texts are distant in time and culture. In translation, it was George Steiner who advanced the application of hermeneutics.

Hermeneutic motion - Based on hermeneutic theories, and on a conception of translation not as a science but as an 'exact art', George Steiner proposes the model of hermeneutic motion to recover ST meaning and transfer it to the TT. It comprises four stages: (1) trust (in which the translator believes there is meaning in the ST); (2) aggression (in which the translator 'enters' the text, extracts the meaning and takes it away); (3) incorporation (in which the meaning is brought into the TT); and (4) compensation (which compensates for the loss of the ST).

33. 1977 | Text and Discourse Analysis | See: Juliane House - 1977; Mona Baker - 1992; Basil Hatim and Ian Mason - 1990; Christiane Nord – 1988

34. 1977 | Juliane House | **Juliane House** – House's model of translation quality assessment starts from a criticism of 'Skopos' theory and other approaches oriented towards the target

The color 🔵 is used to highlight names of entries for Theories/Concepts, while the color 🔴 is used to highlight entries on Figures

audience because of their neglect of the ST (see 'Skopos' Theory and Hans J. Vermeer). This leads to the classification of two different types of TT: overt translation and covert translation.

Translation quality assessment - House bases her model on comparative ST–TT analysis, leading to the assessment of the quality of the translation, highlighting 'mismatches' or 'errors'. Drawing on Halliday's systemic functional grammar, it is centred on a Register analysis of both ST and TT according to Field, Tenor and Mode.

Overt translation and covert translation - For Juliane House, an 'overt translation', such as the translation of a novel, does not present itself as an original text to the TT audience - its status as a translation is clear. In 'covert translation', for example a user's manual for a product, a TT has an equivalent function to the ST in its discourse environment. Both ST and TT address their respective receivers directly. Anything which might remind the target audience of the origin and discourse environment of the ST passes through a 'cultural filter'. According to House, the distinction overt-covert translation is a cline rather than a pair of binary opposites: a text can be more, or less, covert/overt. Both concepts can be traced back to Schleiermacher's alienating and naturalizing approaches (see Schleiermacher; also compare with Foreignization and Domestication in Venuti).

Michael A. K. Halliday - Halliday's systemic functional grammar (SFL) is geared to the study of language as social semiotic. It sees meaning in the writer's linguistic choices and systematically relates these choices to a wider sociocultural framework. The sociocultural environment or 'Context of Culture' is the highest level, and in part conditions the **genre**, understood in SFL as the conventional text type that is associated with a specific communicative function. Genre itself helps to determine other elements in the systemic framework such as **Register**, in SFL a technical term that links the variables of social context to language choice and comprises three elements: (1) **Field**: what is being written about, e.g. the price for a delivery of goods; (2) **Tenor**: who is communicating and to whom, e.g. a sales representative to a customer; and (3) **Mode**: the form of communication, e.g. written or spoken, formal or informal.

35. 1978 | Systems Theories | See: POLYSYSTEM THEORY -1978; Itamar Even-Zohar -1978; DESCRIPTIVE TRANSLATION STUDIES - 1980; Gideon Toury – 1980; MANIPULATION SCHOOL - 1985; Andrew Chesterman - 1997

36. 1978 | Itamar Even-Zohar | **Itamar Even-Zohar** – Israeli scholar based in Tel Aviv who in the 1970s developed the polysystem theory of translation which moves away from the isolated study of individual texts towards the study of translation within the cultural and literary systems in which it functions (See separate entry for Polysystem theory; see also Toury)

37. 1978 | Polysystem theory | **POLYSYSTEM THEORY** - Polysystem theory was developed in the 1970s by Itamar Even-Zohar borrowing ideas from the Russian Formalism of the 1920s. (see separate entry for Itamar Even-Zohar). Even-Zohar considers the overall literary polysystem

The color 🔵 is used to highlight names of entries for Theories/Concepts, while the color 🔴 is used to highlight entries on Figures

to be made up of various component systems that interact and evolve dynamically in a hierarchy. Each of the component systems might change its position and influence over time. Even-Zohar emphasizes that translated literature operates in itself as a system within the overall literary polysystem (1) in the way the TL selects works for translation and (2) in the way translation norms, behaviour and policies are influenced by other co-systems. The position occupied by translated literature in the polysystem conditions the translation strategy. Equivalence is no longer considered to be fixed since it varies according to extra-textual socio-historical conditions (see concept of Equivalence in Jakobson, Nida, Koller and Toury).

Formalism, a critical movement that was developed in Russia between 1910s and 1930s that considered that literary works must not be studied in isolation but as part of a constantly mutating literary system (Yuri Tynyanov). It exerted a strong influence on polysystem theory and on Itamar Even-Zohar. Other theorists of this movement, such as Roman Jakobson, focused on the analysis of the poetic language and later influenced structuralism (see Roman Jakobson) .

38. 1978 | Skopos Theory | **Skopos theory** – The term *skopos* (from the Greek meaning 'purpose') was introduced first by Hans J. Vermeer (see separate entry for Hans Vermeer) in the 1970s as a technical term for the purpose of a translation and the action of translating. The *skopos* is stipulated by the client, commissioner or initiator and determines the translation method and strategy to be employed in order to provide a functionally adequate text in the target culture. Skopos theory allows for the possibility that the same text may be translated in different ways according to the purpose of the TT. With such a TT orientation, text quality assessment criteria based on close equivalence to the ST are not necessarily applicable for assessing the TT (see Translation quality assessment in Juliane House and Equivalence in Nida and Koller). Instead, functional constancy between ST and TT is sought and the criteria of coherence (intratextual) and fidelity (intertextual) are applied. Skopos's consideration of the cultural role of the TT presaged the cultural turn in translation theory (see separate entry for Cultural turn).

39. 1979 | Werner Koller | **Werner Koller** - German translation theorist based in Norway. He proposes a hierarchy of five types of equivalence according to the communicative situation.

Equivalence refers to the translational relationship between a ST unit and a TT unit and corresponds to Saussure's concept of *parole* (see Saussure in Jakobson). For Koller, equivalence needs to be arranged hierarchically. He identifies five types of equivalence (denotative, connotative, text-normative, pragmatic and formal). This is a more detailed categorization than Nida's formal and dynamic equivalence. (See 'Formal and dynamic equivalence' in Nida)

Correspondence A concept from contrastive linguistics that describes the resemblance and difference between words and structures in their linguistic forms. In Koller's model,

The color 🔵 is used to highlight names of entries for Theories/Concepts, while the color 🔴 is used to highlight entries on Figures

correspondence falls within the field of contrastive linguistics, which compares two language systems, and describes differences and similarities contrastively using Saussure's concept of *langue* (see Saussure in Jakobson). Examples given by Koller are the identification of false friends and signs of interference.

40. 1980 | GIDEON TOURY | **Gideon Toury** – Israeli scholar who worked with Even-Zohar in Tel-Aviv and built on polysystem theory to develop a general theory of translation (see Itamar Even-Zohar and Polysystem theory). Toury is the founder of the branch of empirical Descriptive Translation Studies (DTS) with the aim of 'reconstructing' the norms that are in operation in the translation process through the cumulative identification of norms, of probabilistic 'laws' or 'universals of translation' (see also Descriptive Translation Studies).

Norms of translation – term developed by Toury to refer to regularities of the translation behaviour as determined by observation of translation products and processes and the identification of tendencies. In Toury's theory, it is a non-prescriptive concept and is said to occupy a point on a continuum of 'socio-cultural cosntraints' between two extremes of idiosyncracies and 'absolute rules'. Toury proposes the identification of three different kind of norms: (1) initial (concerning the translator's orientation toward the norms of the ST and the norms of the TT, see 'adequate'/'acceptable' translation), (2) preliminary (relating to the translation process, such as translation policy and directness of translation) and (3) operational (matricial and text-linguistic norms) (see also Andrew Chesterman)

Adequate and acceptable translation. If a translation oscillates towards the ST, then the TT will be 'adequate'; if the target culture norms prevail, then the TT will be 'acceptable'. Poles of adequacy and acceptability are on a continuum since no translation is ever totally adequate or totally acceptable.

Translation shifts – For Toury, shifts are inevitable, norm-governed and 'a true universal of translation'. These may be obligatory and non-obligatory (see 'servitude' and 'option' in Vinay and Darbelnet), the latter being of greater interest since they reveal the choices made by the translator (see Vinay and Darbelnet and Catford). Toury refers to the use of a hypothetical intermediate invariant or tertium comparationis against which to gauge translation shifts.

Translation equivalence - A concept developed by Toury for Descriptive Translation Studies. For Toury, it is a 'functional–relational concept' different from the traditional notion of equivalence (compare with the concept of equivalence in Jakobson, Nida and Koller). As in functional theories, equivalence is assumed between a TT and a ST. Analysis does not then focus prescriptively on whether a given TT or TT-expression is 'equivalent' to the ST or ST-expression. Instead it focuses on how the assumed equivalence has been realized and as a tool for uncovering the decision-making process and the factors that have shaped the translation.

'laws' of translation – Within the framework of Descriptive Translation Studies, Toury aims to establish probabilistic laws of translation through the identification of norms of translation. He proposes two laws: (1) the law of growing standardization (stating that potential TL choices are sometimes ignored) and (2) the law of interference (which states that the lexical syntactic form of the ST influences the TT and produces non-normal patterns). Pym ('On Toury's laws and how to

The color 🔵 is used to highlight names of entries for Theories/Concepts, while the color 🔴 is used to highlight entries on Figures

translate', 2008) suggests resolving the apparent contradiction between the two by stressing that the use of one rather than the other will depend on the socio-historical conditions under which translation occurs.

Universals of translation – Term used to refer to features that are considered to characterize translated language and texts in whatever language pair, such as lexical and syntactic simplification, explicitation and normalization to TL patterns. They are linked to the concept of laws of translation, a weaker form of universal. Because of their capacity to analyse large amounts of data, methods from corpus-based translation studies are useful in identifying patterns that can lead to the deduction of universals (see separate entry for Corpus-based translation studies).

Tertium comparationis is an invariant against which a ST-TT pair of text segments can be measured to gauge any shift in meaning.

41. 1980 - DESCRIPTIVE TRANSLATION STUDIES | **DESCRIPTIVE TRANSLATION STUDIES** (DTS) an empirical branch of the discipline founded by Gideon Toury (see separate entry) that aims to reconstruct the norms that have been in operation during the translation process and to formulate probabilistic 'laws of translation'. Toury proposes a three-phase methodology for systematic DTS, (1) identifying the wider role of the sociocultural system, (2) incorporating a textual analysis of the product and (3) drawing a generalization of the patterns identified in the text. The examination of the ST and TT should reveal shifts in the relations between the two that have taken place in translation.

42. 1980 - SUSAN BASSNET | **Susan Bassnett** - professor of Comparative Literature who founded the Centre for Translation and Comparative Cultural Studies at the University of Warwick, UK. Her many works include the foundational text *Translation Studies*, first published in 1980, and Postcolonial Translation Studies (1999, edited jointly with Harish Trivedi). She is a leading figure in the Cultural turn (see separate entry for Cultural turn) . **André Lefevere** (1945-1996) Belgian translation theorist who worked in comparative literature departments in Leuven (Belgium) and the USA (University of Texas at Austin). His work in translation studies, associated with the Cultural turn (see separate entry for Cultural turn) , developed out of his strong links with Polysystem theory and the Manipulation School (see separate entries for Polysystem Theory and the Manipulation School) . For Lefevere translation was a powerful form of 'rewriting' in which ideology plays a pivotal role (see Translation and Ideology).

43. 1981 - PETER NEWMARK | **Peter Newmark** (1916-2011) — UK-based translation theorist. Newmark's approach departs from Nida's receptor-oriented focus (see Nida) and rejects the idea that full equivalent effect can ever be fully achieved in translation (e.g., in the case of

The color 🔵 is used to highlight names of entries for Theories/Concepts, while the color 🔴 is used to highlight entries on Figures

very old texts). Newmark proposes instead the concepts of semantic and communicative translation.

Semantic translation and communicative translation. For Newmark, semantic equivalence attempts to recreate as far as possible the contextual meaning of a ST in a TT within the syntactic and semantic limitations of the TT. This concept is different from literal translation (see Cicero) in that it considers and respects context, interprets and even explains when necessary. Communicative translation aims to recreate as far as possible the same effect on its TT receptor as the ST has on the ST audience. It is therefore more TT oriented than semantic translation. The concepts of semantic and communicative translation are similar to Nida's dynamic and formal equivalence (see 'Formal and dynamic equivalence' in Nida).

44. 1982 | AUDIOVISUAL TRANSLATION | **Audiovisual translation** – refers to translation of products, such as films, plays, opera, video games and hypertexts, with a multi-code and multi-channel type of communication, where the verbal component will tend to be highly dependent on the visuals. While the translator mainly operates on the verbal level, the translation process will be frequently constrained by the visual code. Dubbing, voice-over and subtitling are the most common modalities adopted in audiovisual translation. (See separate entries for Dubbing, voice-over and subtitling are the most common modalities adopted in audiovisual translation.)

Dubbing – A form of audiovisual translation adopted in some contexts for cinema and television products (films, documentaries, series, etc) in which the original spoken track is replaced by a fresh spoken track in the TL. In dubbing an important consideration is normally 'lip-sync', the co-ordination of lip movement with the TL spoken word.

Voice-over - a translation modality used mainly in informative, non-fictional screen products such as news programmes, advertisements and documentaries. The TL soundtrack is read over the SL words. The SL will normally be only slightly noticeable, apart from the initial and final utterances of the original narrator.

Subtitling – Subtitling has been defined by Henrik Gottlieb as 'the rendering in a different language of verbal messages in filmic media, in the shape of one or more lines of written text presented on the screen in sync with the original written message'. These may be: (1) interlingual (which can be 'open', controlled by each individual viewer as in DVDs, or 'closed', an integral part of the film); (2) intralingual (in the same language, mainly for the hard of hearing and (3) bilingual (in countries such as Belgium where subtitles are provided in two languages). The space and time constraints imposed on intralingual subtitling (normally a maximum of two lines of text and a duration of around six seconds for each caption) lead to a necessary reduction in the number of words on the screen. Other obvious additional constraints on the translation are the image on the screen, which normally cannot be contradicted, and the soundtrack in the source.

The color 🔵 is used to highlight names of entries for Theories/Concepts, while the color 🔴 is used to highlight entries on Figures

Surtitling – In an opera, titles which are projected above or to the side of the stage or, increasingly, on the backs of the seats in front of the viewer. Surtitles are 'closed' (they are not controlled by the viewer) and can be seen by the entire audience.

Fansubs – Term used to refer to the practice of amateur ('made by fans') subtitling and distribution of films, TV series and other film extracts online and video games. Its practice is controversial as it involves a violation of copyright laws in many countries. It was originally used for the translation of mainly Japanese *manga* and *animé* cartoons and the practice has now proliferated thanks to the greater access to and affordability of subtitling software.

Video game translation - a blend of audiovisual translation and software localization. One important defining feature is the creativity and originality that is demanded of the translator in order to ensure that the game is entertaining. Such creativity, termed transcreation, often includes the re-naming of elements and characters, the use of neologisms and the deliberate choice of non-standard dialects

Transcreation – Term used to refer to refer to a strategy of translation that stresses the creativity and transformative nature of the process. Originally, this term was employed by the Indian translator and academic Purushottama Lal (1964) for his domesticating English translations of Sanskrit plays and later used by the Brazilian writer Haroldo de Campos and the Brazilian postcolonial theorist Else Vieira (see Cannibalist translation theories in Students Content from previous editions). In more recent times, it has been used of the creative adaptation of advertisements and videogames.

45. 1984 | THE TRANSLATOR'S ROLE | See: Lawrence Venuti – 1992 to present date; Antoine Berman – 1984

46. 1984 | ANTOINE BERMAN | **Antoine Berman** (1942-1991) - French theorist and translator whose work preceded and influenced Venuti (see separate entry for Venuti). Berman deplored the general tendency to negate the foreign in translation by the strategy of 'naturalization', which would equate with Venuti's later domestication. He used the terms 'negative analytic' and 'positive analytic' to describe the process of translation.

negative analytic and **positive analytic** – 'Negative analytic' describes the system of textual deformation that conceals or eliminates foreignness in translation. Contrasting to this process is the 'positive analytic' that allows translators to bring the sense of the foreign into the TT through a creative process of literal translation, which for Berman has a more specific meaning ('translation of the letter') than the conventional use (see Cicero).

47. 1984 | HANS J. VERMEER | **Hans J. Vermeer** (1930-2010) – German linguist and translator scholar who, first on his own in the 1970s and later working with Katharina Reiss (see separate entry for Katharina Reiss), developed the skopos theory of translation. In their co-authored book *Grundlegung einer allgemeinen Translationstheorie* ['Groundwork for a General Theory of Translation'] (1984), Reiss and Vermeer aim for a general translation theory

The color 🔵 is used to highlight names of entries for Theories/Concepts, while the color 🔴 is used to highlight entries on Figures

for all texts. The first part sets out a detailed explanation of Vermeer's skopos theory, whereas the second adapts Reiss's functional text-type model to the general theory.

48. 1984 | TRANSLATORIAL ACTION | **Translatorial action model – Justa Holz Mänttäri's** model of translation which views translation as purpose-driven, outcome-oriented human interaction involving intercultural transfer. Interlingual translation involves a series of roles and players (ie. the initiator, the commissioner, the ST producer, the TT producer, the TT user, the TT receiver) with specific primary and secondary goals. The translation action model focuses on producing a TT that is functionally communicative for the receiver. The Finnish-based German theorist Holz Mänttäri developed this theory in her work *Translatorisches Handeln: Theorie und Methode* ('Translatorial Action: Theory and method, 1984), taking up concepts from communication theory and action theory.

49. 1985 | 'ABUSIVE FIDELITY' | **'Abusive fidelity'-** Term introduced by Philip Lewis (1985), drawing on deconstruction (see separate entry) to denote a radical and risk-taking approach to literary translation. For him, 'abusive translation' is a strong, forceful translation that values experimentation, tampers with usage, seeks to match the multiplicity of voices of the ST by producing its own.

50. 1985 | 'THE MANIPULATION SCHOOL | **The Manipulation School** – Group of scholars centred in Belgium, Israel and the Netherlands in the 1970s and 1980s who worked in Descriptive Translation Studies (see separate entry). Their key publication was the collection of papers entitled *The Manipulation of Literature: Studies in Literary Translation* (Hermans (ed.) 1985). The group viewed translation primarily as a literary genre which subjected the ST to a degree of manipulation. Lambert and van Gorp (1985) drew on Even-Zohar's and Toury's early work (see separate entries for Itamar Even-Zohar and Gideon Toury) in their proposed scheme for the comparison of the ST and TT literary systems and for the description of relations within them. The Manipulation school subsequently influenced more recent work on translation and ideology (see separate entry for Translation and Ideology).

51. 1985 | DECONSTRUCTION | **Deconstruction** - Term introduced in the 1960s by Jacques Derrida (1930-2004), drawing on the work of Martin Heiddeger (1889-1976). Deconstruction dismantles some of the key premises of linguistics, the terms, systems and concepts which are constructed by language, starting with Saussure's clear division of signified and signifier (see Saussure in Jakobson). It challenges the capacity to define, capture or stabilize meaning and thus undermines the concept of equivalence of meaning in translation (see Jakobson and Nida).

52. 1988 | CULTURAL TURN | **'Cultural turn'** - a term coined by Mary Snell-Hornby in Susan Bassnett and André Lefevere's *Translation, History and Culture* (1990) to refer to a major new

The color 🔵 is used to highlight names of entries for Theories/Concepts, while the color 🔴 is used to highlight entries on Figures

development in translation studies (see separate entries for Mary Snell-Hornby, Susan Bassnett and André Lefevere) . Rather than being restricted to a transparent and balanced linguistic transaction, translation was perceived as a more complex and power-driven process of negotiation between two cultures influenced by their historical and social circumstances. It drew inspiration from the development of cultural studies from the 1960s onwards.

53. 1988 | TRANSLATION AND GENDER | **Translation and gender** – As part of the cultural turn in translation studies and partly as a result of feminist protest movement that developed in Western Europe and North America in the mid-1960s, some scholars have concentrated on the intersection of gender and translation. For example, this has involved criticism of the male-dominated metaphorics of *les belles infidèles* and has promoted "committed" approaches such as the Canadian feminist translation project which seeks to make the female visible in translation. Other scholars have concentrated on the translation of gay writers and texts. (See also Cultural turn).

54. 1988 | CHRISTIANE NORD | **Christiane Nord** – Nord's model of translation put forward in her book *Text Analysis in Translation* (1988/2005) is a detailed functional translation-oriented text analysis model which examines text organization at or above sentence level. Nord's model enables understanding of the function of the features and the selection of translation strategies appropriate to the intended purpose of the translation. Her model stresses the importance of a 'functionality plus loyalty' principle. She distinguishes two basic types of translation: documentary translation and instrumental translation.

'functionality plus loyalty' principle - Rather than the fulfilment of TT purpose being the overriding principle in translation, as in 'Skopos' theory (see 'Skopos' Theory and Hans J. Vermeer), Nord maintains that there also needs to be a relationship between the ST and the TT. Purpose must be compatible with author intention, and loyalty to this intention restricts the possible interpretations made by the translator.

documentary and instrumental translation - In Nord's model, documentary translation functions as a document of a source culture communication. The documentary TT allows the receiver access to the ideas of the ST but in full knowledge that it is a translation. With an instrumental translation, on the other hand, the TT receivers read the TT as though it were a ST written in their own language and the function may be the same for both ST and TT.

55. 1988 | MARY SNELL-HORNBY | Austrian-based scholar and translator whose work, *Translation Studies: An Integrated Approach* (1988/95), reviews and attempts to integrate a wide variety of different linguistic and literary concepts in an overarching 'integrated approach' to translation based on text types.

The color 🔵 is used to highlight names of entries for Theories/Concepts, while the color 🔴 is used to highlight entries on Figures

56. 1990 | ANDRÉ LEFEVERE | André Lefevere (1945–1996): Lefevere was a Belgian translation theorist who worked in comparative literature departments in Leuven (Belgium) and the USA (University of Texas at Austin). His work in translation studies, associated with the cultural turn (see separate entry), developed out of his strong links with polysystem theory and the Manipulation School. For Lefevere, translation was a powerful form of 'rewriting' in which ideology plays a pivotal role.

'Translation as rewriting': This term was coined by Lefevere to describe the power factors that govern the transformation of literary texts in translation and their reception, acceptance or rejection. These include issues such as power, ideology, institution and manipulation. Lefevere points out that the institutions (e.g. the State, publishers, schools and universities) and individuals in such power positions are the ones that control the consumption of translated literature by the general public. They are described as: (1) professionals within the literary system, who partly determine the dominant poetics; and (2) patronage outside the literary system, which partly determines the ideology.

57. 1990 | BASIL HATIM & IAN MASON | **Basil Hatim and Ian Mason** – In their *Discourse and the Translator* (1990) and *The Translator as Communicator* (1997), Hatim and Mason apply Halliday's linguistic model to the analysis of translation (see Juliane House), paying particular attention to the realization in translation of ideational (e.g. transitivity) and inter-personal functions (e.g. modality) as well as cohesion (see Mona Baker). Translation analysis aims to identify marked (prominent or unusual) forms and 'dynamic' and 'stable' elements in a text. More stable elements may be translated literally while more dynamic elements require more creative responses on the part of the translator.

58. 1991 | COGNITIVE MODELS OF TRANSLATION | Cognitive models of translation examine and explain the processes of translation, through both theories of communication, such as relevance theory and the interpretive model, and through observation and empirical methods, which include 'think aloud' protocol and eye-tracking.

Relevance theory: Ernst-August Gutt draws on relevance theory (Sperber and Wilson 1986), which focuses on the importance of intention in human communication. In his *Translation as Relevance* (1991/2000), Gutt describes translation as an example of a communication based around a cause-and-effect model of inferencing and interpretation. Translators need to decide if it is possible to communicate the informative intention, whether to translate descriptively or interpretively, what the degree of resemblance to the ST should be, and so on. These decisions are based on the translator's evaluation of the cognitive environment of the receiver.

The color 🔵 is used to highlight names of entries for Theories/Concepts, while the color 🔴 is used to highlight entries on Figures

Interpretive model: Marianne Lederer and Danica Seleskovich put forward the 'interpretive model', initially applied to conference interpreting, which explains translation as an overlapping three-stage process of understanding, deverbalization and re-expression.

'Think-aloud' protocol: A method of investigating the translation process, coming from the field of psychology and developed by Ericsson and Simon (1984). The translator is asked to verbalize his/her thought processes while translating or immediately afterwards (the latter known as 'retrospective protocol'), often with no prompting on content.

Eye-tracking: A recent methodology used for investigating reading and production processes. Eye-tracking equipment records the focus of a translator's gaze as they process a text on-screen. It is sometimes combined with the recording of key-strokes made by the translator at the keyboard to help investigate points of greatest cognitive effort.

59. 1992 | LAWRENCE VENUTI | **Lawrence Venuti** - American translator and translation theorist. Venuti contests Toury's 'scientific' descriptive model with its aim of producing 'value-free' norms and laws of translation (see Norms of translation in Gideon Toury and Andrew Chesterman). Venuti takes into account the value-driven nature of the social and political institutions that influence translation. In this context, he analyses the US and UK hegemony in the publishing industry. Venuti introduced the terms translator's invisibility and domestication and foreignization to refer to translation practices which are available to the translator.

The translator's invisibility - Drawing on his own experiences as translator of experimental Italian poetry and fiction, Lawrence Venuti introduced the term to describe the translator's situation and activity in contemporary British and American cultures where translators are 'invisible' because of fluent translation practices which produce an 'illusion of transparency'; and because translated texts are typically read in the target culture as if they were originals. Venuti discusses invisibility in relation to two types of translation practice: domestication and foreignization.

Domestication – Venuti introduced the term 'domestication' and its opposite 'foreignization', drawing on Schleiermacher (see naturalizing and alienating in Schleiermacher). Venuti considers this strategy dominant in the context of the British and American translation tradition. For Venuti, it is a type of fluent translation practice which minimises the foreignness of the text and leads to the translator's invisibility.

Foreignization – Venuti introduced the term 'foreignization' and its opposite 'domestication', drawing on Schleiermacher (see alienating and naturalizing in Schleiermacher). Foreignization aims to make the receiving culture aware of the linguistic and cultural difference inherent in the foreign text. This is to be achieved by a non-fluent, estranging translation style. Foreignization may involve lexical and syntactic borrowing and calques, reflects the SL norms and reminds the target culture readers that they are dealing with a translation.

60. 1992 | MONA BAKER | **Mona Baker** – In the influential *In Other Words* (1992/2011), Baker looks at equivalence at a series of levels: at the level of lexical meaning, above word level, at the level of grammar, textual equivalence and pragmatic equivalence (compare with 'Formal and

The color 🔵 is used to highlight names of entries for Theories/Concepts, while the color 🔴 is used to highlight entries on Figures

dynamic equivalence' in Nida and 'Equivalence' in Koller). Baker's later work includes important work on narrative theory and translation.

textual equivalence – Mona Baker draws on Halliday (see Juliane House) for her analysis of thematic (word order) and information structure and cohesion. An important point for ST thematic analysis is that the translator should be aware of the **relative markedness** (prominence or unusualness) of the structures which can help understand the choices made by speakers and writers when conveying a message. This in turn can help the translator to decide whether it is appropriate to translate using a particular marked form.

pragmatic equivalence – Pragmatics is the study of language and meaning in communicative situations. Baker considers the major pragmatic concepts of coherence (the overall hanging-together of the arguments of a text) and implicature (the process of implying meaning).

Cohesion - This term refers to the grammatical and lexical links which help a text hold together. A single instance of cohesion is termed a tie. In Halliday and Hasan's seminal model of cohesion in English (1976) there are five types of tie: (1) reference (pronouns, comparatives, demonstratives); (2) substitution and ellipsis; (3) conjunction; (4) collocation; and (5) lexical cohesion through repetition, synonymy, semantic fields, etc.

61. 1992 | POSTCOLONIAL TRANSLATION STUDIES | **Postcolonial translation studies** – This area developed from the 1990s as part of the cultural turn in translation studies and as a result of a cross-over from postcolonial studies (see separate entry on Cultural turn). Both postcolonial studies and translation studies look at the issues of power relations and control expressed through language and literature in postcolonial societies. Translation has been seen and studied as an instrument for colonial domination. Thus, scholars such as Gayatri Spivak look at the 'politics of translation' that gives prominence to English and to the other 'hegemonic' languages of the ex-colonizers, and Tejaswini Niranjana describes how translation has played an active role in the colonization process in India, disseminating an ideologically motivated image of colonized peoples and imposing the colonizer's ideological values. More recent work, such as Paul Bandia's *Translation as Reparation* (St Jerome Publishing, 2008) has examined the picture in Africa, where translation occurs not only between indigenous and colonial languages but also between colonial languages (notably English and French) themselves. Important concepts are 'in-betweenness', 'the third space' and 'hybridity' (Homi Bhabha) and the multilingual environment of such societies in which translation is an everyday occurrence.

62. 1995 - CORPUS-BASED TRANSLATION STUDIES | Corpus-based translation studies: A branch of the discipline that draws on the tools and concepts of corpus linguistics, initiated as a lexicographical tool for the Collins COBUILD dictionaries in the 1980s. The 'corpus' (plural 'corpora') refers to an electronic collection of naturally occurring texts, selected and gathered for a specific purpose, which can then be processed and analysed with software to investigate the use and patterns of the word-forms it contains. For translation purposes these may be: (1)

The color 🔵 is used to highlight names of entries for Theories/Concepts, while the color 🔴 is used to highlight entries on Figures

parallel corpora (aligned pairs of STs and TTs that are used to investigate translation phenomena); (2) bilingual comparable corpora (similar STs in the two languages which can be used to find specialized terms in the TL); or (3) monolingual reference corpora (collections of STs that can be used to identify common patterns in a language).

The major reason for using computer corpora is the quality of linguistic evidence, vastly superior to the analyst's intuition, particularly on collocations and typical uses of lexical items, and stylistic features. The corpus-based approach links with methodology centred in Descriptive Translation Studies and to analyse typical features of translation, such as universals of translation.

63. 1996 | Translation and Ideology | **Translation and ideology** – Much research from an ideological perspective is interested in uncovering manipulations in the TT that may be indicative of the translator's conscious ideology or produced by ideological elements of the translation environment, such as pressure from the publisher, editor or institutional/governmental circles. The disparity in status between languages is also crucial, the more powerful 'world languages' such as English even threatening the survival of certain genres in lesser-used languages (See also Lefevere, Hatim and Mason, the Manipulation School, Translation and narrative theory, Cultural turn, Translation and gender, Postcolonial translation studies and The translator's invisibility in [Lawrence Venuti]).

64. 1997 | ANDREW CHESTERMAN | **Andrew Chesterman** - British scholar based in Finland whose work on norms of translation builds on the theories of Toury (see separate entry for Gideon Toury). He has also developed the concept of 'consilience' or coming together of various trends of translation study.

Norms of translation: Chesterman suggests a different classification of norms compared to Toury: (1) product/expectancy norms (which refer to the TT reader's concept of translation and expectations regarding the TT) and (2) professional norms, including an ethical norm of accountability (the translator accepts responsibility for the translated work), a norm of communication (ensuring satisfactory communication) and of relation (of the ST to the TT). (See also norms of translation in Toury).

Consilience: Chesterman has proposed the concept of 'consilience', or coming together of various trends of translation study research, which aims to overcome the linguistics-cultural studies divide. He proposes a classification of four 'complementary [though overlapping] approaches' to research into translation: (1) the textual, (2) the cognitive, (3) the sociological and (4) the cultural.

65. 1998 - COMPUTER-ASSISTED TRANSLATION (CAT) TOOLS | Computer-assisted translation tools (CAT tools): A term used to refer to different software applications used by

The color 🔵 is used to highlight names of entries for Theories/Concepts, while the color 🔴 is used to highlight entries on Figures

professional translators to assist translation and localization. In particular, translation memory tools work on searchable aligned databases of previous STs and their translations to allow for the extraction of previous translation equivalents and terms. These are used to indicate matches with items in the text on which the translator is working.

66. 1998 - SOCIOLOGY OF TRANSLATION | **Sociology of translation** – Study of translation has recently turned to the study of translators. Translators are studied as active agents, drawing mainly on the theory of French ethnographer and sociologist Pierre Bourdieu and his concepts of field, habitus, capital and illusio. Daniel Simeoni (1948-2007) highlights the study of the 'translatorial habitus' (the translator's 'mindset' or 'cultural mind') which can complement and enhance Toury's work by focusing on how the translator's own behaviour and agency contribute to the establishment of norms (see separate entry for Toury). Bourdieu's theorization can help explain how translators and interpreters both take part in and construct 'the forms of practice in which they engage' (Moira Inghilleri, *Bourdieu and the Sociology of Translation and Interpreting*, 2005). (See also Andrew Chesterman: norms of translation).

67. 2000 - LOCALIZATION | Localization may be defined as the adaptation of a product to the linguistic and cultural expectations of the target 'locale' or geographical region and language in which a text operates. This may also involve, for example, the substitution of cultural symbols as well as the translation of the text. It is often associated with the translation of websites and video games where there are specific spacial constraints and the need to ensure online functionality.

68. 2006 | TRANSLATION AND NARRATIVE THEORY | **Translation and narrative theory** – Mona Baker's *Translation and Conflict* (2006) (see Mona Baker) draws on the notion of narrative in social and communication theory (e.g. Somers and Gibson, and Fisher) to explain how narratives construct as well as represent the world around us, often in the interests of a political élite. Translation and interpreting introduce a new narrative into a text, dependent upon the perspective of those involved. This is illustrated through examples such as the repositioning of participants through paratextual commentary and, at the lexical level, through renaming (e.g.the choice to use either *Judea and Samaria* or *West Bank* in the Middle East). (See also Cultural turn).
